1	ABSTRACT
1	VD2 I VVCI

The instant invention involves the use of a combination 2 of preparatory steps in conjunction with mass spectroscopy 3 4 and time-of-flight detection procedures to maximize the 5 diversity of biopolymers which are verifiable within a particular sample. The cohort of biopolymers verified within 6 7 such a sample is then viewed with reference to their ability 8 to evidence at least one particular disease state; thereby 9 enabling a diagnostician to gain the ability to characterize either the presence or absence of said at least one disease 10 11 state relative to recognition of the presence and/or the 12 absence of said biopolymer.
